

Open Solution

Securely import data from various external sources, such as Fuel Systems and ticket machine-based first-use checks; and exports to Accounting Systems, Operations Systems and Windows-based applications such as Excel, CSV, XML, HTML etc. Other interfaces can be accommodated as well.

eg Triscan, Balvin. The fuel import facility allows you to map your import file and save the layout as a template. Next time, only pick up your file and click import. A more sophisticated option is also available where your fuel files are sent to a watch folder that Freeway monitors. Once a new file is recognised Freeway will pick it up and process the import.

Fuel Systems

Any errors in imported data, such as unidentified vehicles, are logged in such a way that they can easily be re-imported when the error has been corrected.

freeway

Windows Applications

Freeway is made up of a range of grid views. Ability to rearrange and sort column headers are user-defined. Export any grid view of data to Excel, Text, CSV, HTMS, XLM

Accounting Systems

eg Sage, SAP, Oracle, Accpac, Syspro, Accpac, Pastel etc. Choose the manual export option or the more sophisticated auto export which will export invoices that are matched without error using Optical Character Recognition

Operations Systems

Export live vehicle status. If vehicles are flagged as 'unfit' (critical defect or overdue scheduled event) then your traffic system will be notified that the vehicle is unavailable for operation. New vehicle creation is processed in Freeway and exported to your Transport Management System
